Physical Development Toddlerhood

What are some bodily changes?

- Children lose baby fat and become leaner
- Growth slows from infancy to toddlerhood but remains rapid
- About 6 months of age solid food could become part of diet

Factors Influencing Growth

Environmental Stress:

- Constant stress causes reduction in Human Growth Hormone (HGH)
- Children in families with chronic conflict are more likely to be in the bottom 20% of height (Montgomery, Bartley, and Wilkinson, 1997)
- What is our biological response to stress?
- Fight or Flight
- Chronic stress?= Chronic Fight or Flight
- Irreparable damage to lifelong physical and mental health

Early childhood stress/poverty/adversity affects lifelong health

- Growing up poor/in adversity leads to impaired health over a lifetime due to chronic stress (unresolved fight or flight)
- Growing up in extreme adversity cannot be made up for by later wealth and abundance.

- https://www.ted.com/talks/nadine_burke_harris_how_childhood_trauma_affects_health_across_a_lifetime?language=en

What are these Adverse Childhood Experience?

ACES score: 1 point for each Yes Response

ACES are extremely common

Very high incidence in our community

Category of childhood exposure ^a
Abuse by category
Psychological
<i>(Did a parent or other adult in the household . . .)</i>
Often or very often swear at, insult, or put you down?
Often or very often act in a way that made you afraid that you would be physically hurt?
Physical
<i>(Did a parent or other adult in the household . . .)</i>
Often or very often push, grab, shove, or slap you?
Often or very often hit you so hard that you had marks or were injured?
Sexual
<i>(Did an adult or person at least 5 years older ever . . .)</i>
Touch or fondle you in a sexual way?
Have you touch their body in a sexual way?
Attempt oral, anal, or vaginal intercourse with you?
Actually have oral, anal, or vaginal intercourse with you?
Household dysfunction by category
Substance abuse
Live with anyone who was a problem drinker or alcoholic?
Live with anyone who used street drugs?
Mental illness
Was a household member depressed or mentally ill?
Did a household member attempt suicide?
Mother treated violently
<i>Was your mother (or stepmother)</i>
Sometimes, often, or very often pushed, grabbed, slapped, or had something thrown at her?
Sometimes, often, or very often kicked, bitten, hit with a fist, or hit with something hard?
Ever repeatedly hit over at least a few minutes?
Ever threatened with, or hurt by, a knife or gun?
Criminal behavior in household
Did a household member go to prison?

Gross motor development

Age (Months)	Milestone
9 to 16	Stand alone
9 to 17	Walk without support
11 to 19	Stand on one leg
11 to 21	Climb onto chairs, beds, up stairs, etc.
13 to 17	Walk backward
14 to 22	Run
17 to 30	Jump in place
16 to 30	Walk on tiptoes
22 to 36	Walk up and down stairs

Toilet training

- Erikson's theory: Psychosocial task of toddlerhood
- **Autonomy versus Shame.**
- **Virtue: Self- Confidence, Self Reliance.**
- Toilet training is an important event via which caregivers support or impede autonomy.
- Goal is to guide child behavior WHILE empowering child by accepting their choices.

You know that by age three Indira needs to be toilet trained for daycare/preschool. You buy a potty chair, training pants, and a little storybook about a child learning to use the potty

- A) To speed things up, you begin to scold her for soiled diapers, and say that you want her to wear the training pants and use the potty.
- B) You put her on the potty about every half an hour and praise her lavishly if she happens to use it.
- ★ C) You praise her for small steps such as trying on the training pants and sitting on the chair, even if nothing happens.

I could worry she will not be potty trained in time

C- Child is empowered-

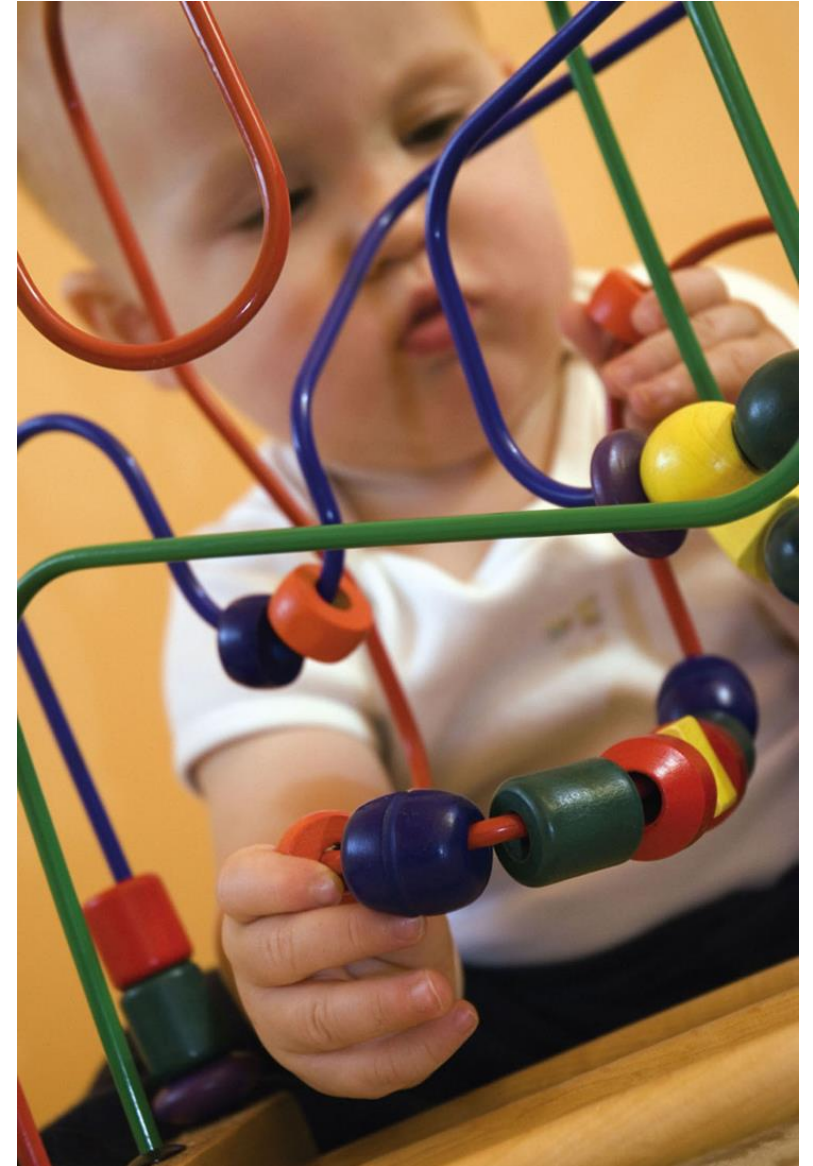

B is good, but you are in charge-not her as much.

Is it time?

- 4 ways to identify it is time for toilet training
 - Staying dry for hour or two during the day
 - Regular bowel movements
 - Increased anticipation of the event
- Directly asking to use the toilet or wear underwear

Cognitive Development in Toddlerhood

The symbolic child

Main Traits and Accomplishments of the Four Stages of Cognitive Development in Jean Piaget's Theory

Stage of Cognitive Development	Traits and Accomplishments
Sensorimotor stage (0 to 2 years old)	<i>Cognition is practical.</i> ("I see and touch, therefore I know") Object permanence Deferred imitation Mean-Goals mental coordination
Preoperational stage (2 to 7 years old)	<i>Cognition is symbolic and intuitive.</i> ("I can think with my head, without my hands, but logic escapes me and appearance is reality") Expression of the symbolic function (for example, images, language, drawing, symbolic play) Magical thinking (for example, animism, finalism, artificialism, realism)
Concrete operational stage (7 to 11 years old)	<i>Cognition becomes logical, although restricted to concrete entities.</i> ("I can do it without hands and with logic, but my logic fails a bit if problems are not touchable") Conservation Classification Seriation
Formal operational stage (11 to 16 years old)	<i>Cognition becomes logical and abstract.</i> ("I can think and solve problems proficiently without the need of concrete stuff, and I can even imagine many other possibilities") Hypothetico-deductive thinking Abstract thinking

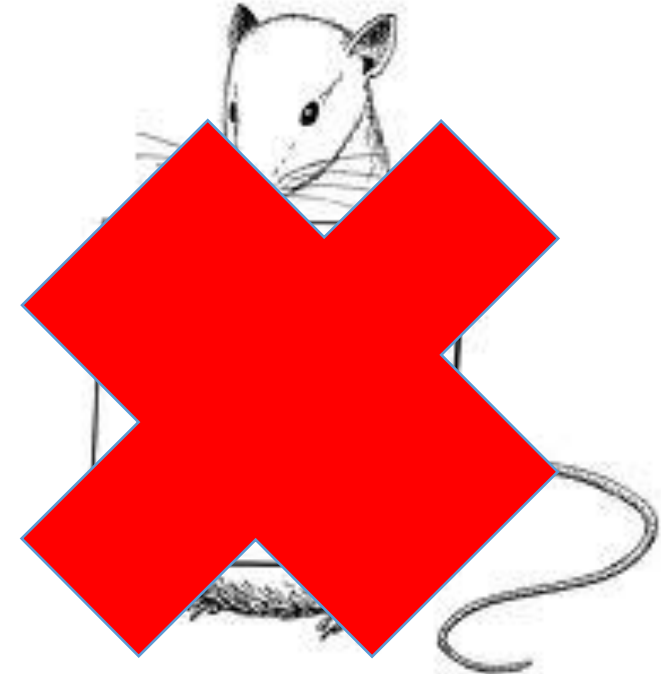

What are some symbols that toddlers begin to use?

- What is a symbol?
- Something STANDS for Something else
- Language- Words are symbols
- Mental representations are raw materials for ideas, speech, play etc.

Language: How is it acquired?

- Behaviorist position: acquired via learning
 - Operant and Classical Conditioning
 - Systems of Reward

But does this make sense?
NO!

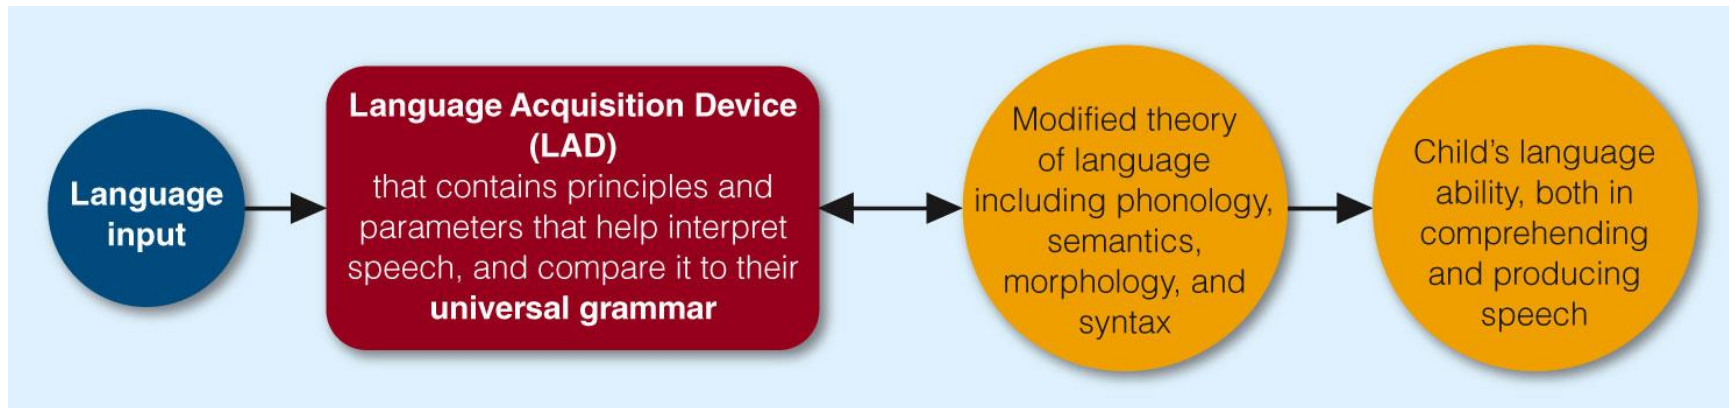

Modern Theories of language acquisition

- Children are *prepared* for learning language.
All humans have a *predisposition* for acquiring
their culture's language

Nativism

- ▶ Structures and processes for acquiring language are innate
- ▶ Modified by culture (otherwise we would all be speaking the same thing)
 - ▶ Call this the *language instinct*

Vocabulary

- 12mo to 18mo- slow expansion, steady but slow pace
- Use of holophrases : One word stands for many sentences
 - UNDEREXTENSIONS
 - The use of a general word only for one specific object
 - Example: Only our cat is called "Cat"
 - OVEREXTENSION
 - The use of a specific word to mean many related objects
 - Example: All cats are called "Fluffy"

Vocabulary

Around 18 months

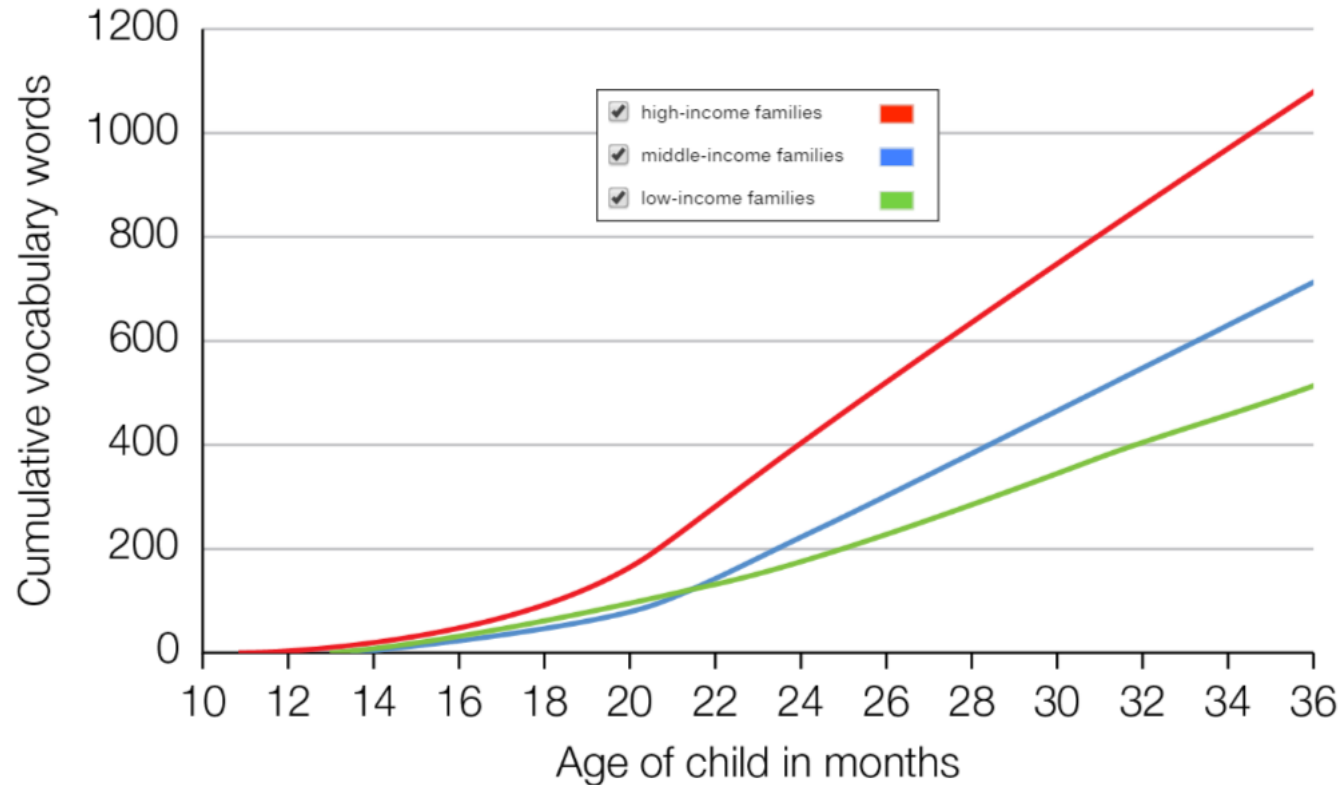

Word Spurt-explosion of new vocab words

- **Fast mapping**- children learn new words with minimal input.
- They assign novel names to novel objects
- **Telegraphic Speech**- Early sentences are like old time telegram messages
“I go. Want park. Daddy play”
- **Overregularization**- The misapplication of grammar rules
- **Was-ed, went-ed, foot-ses, etc.**

Cultural Contexts and Language Development

- SES and language development

Interactive

Media Use in Toddlerhood

- 58% of children under 3 watch TV everyday
- Displacement effect is a concern: What else could children be doing instead of watching TV? Human interaction
- **It is suggested that children less than 2 years of age watch no TV at all**
- Older children no more than 2 hours of television per day

Emotional and Social Development in Toddlerhood

Important: Attachment in everyday language is not
same as attachment in child development

It is more than love and affection.

Attachment- Infant-Caregiver Bond

- It is a motivational system with two specific functions:
 - Secure base function
 - Safe haven function
- Based on how well these two functions are met,
- Attachment is Secure
- OR Insecure (Avoidant, Resistant, Disorganized)
- Do not say “Attachment is GOOD or Not so GOOD”

How can we assess the goodness of the attachment bond ?

Protection

Exploration

Safe haven

Secure Base

Harlow & Zimmerman, 1959

Individual Differences in Attachment styles

- Mary Ainsworth (1969) studied infants across cultures- Uganda and Maryland
- **Difference in Maternal sensitivity and Responsiveness** in the first few months of life predicted later attachment behavior
- In 1978, she developed a laboratory procedure to assess different attachment behaviors
 - “The Strange Situation”

The Strange Situation

- Indicators of attachment security:

1. Use of Parent as a Secure Base

- ❖ Quality of play and exploration in the presence and absence of caregiver.

2. Use of parent as a Haven of safety

- ❖ Reactions to the reunion.
 - Enthusiasm of greeting
 - Effectiveness of contact with caregiver in reducing distress

Individual Differences in Attachment Styles

☐ Secure Attachment (60-65%)

☒ **Active exploration of the room, distress when caregiver leaves, enthusiastic greeting at reunion**

☐ Insecure-Resistant (Ambivalent) Attachment (10-15%)

☒ **Very little exploration, anxious even in presence of caregiver, distressed when caregiver leaves, displays anger at reunion**

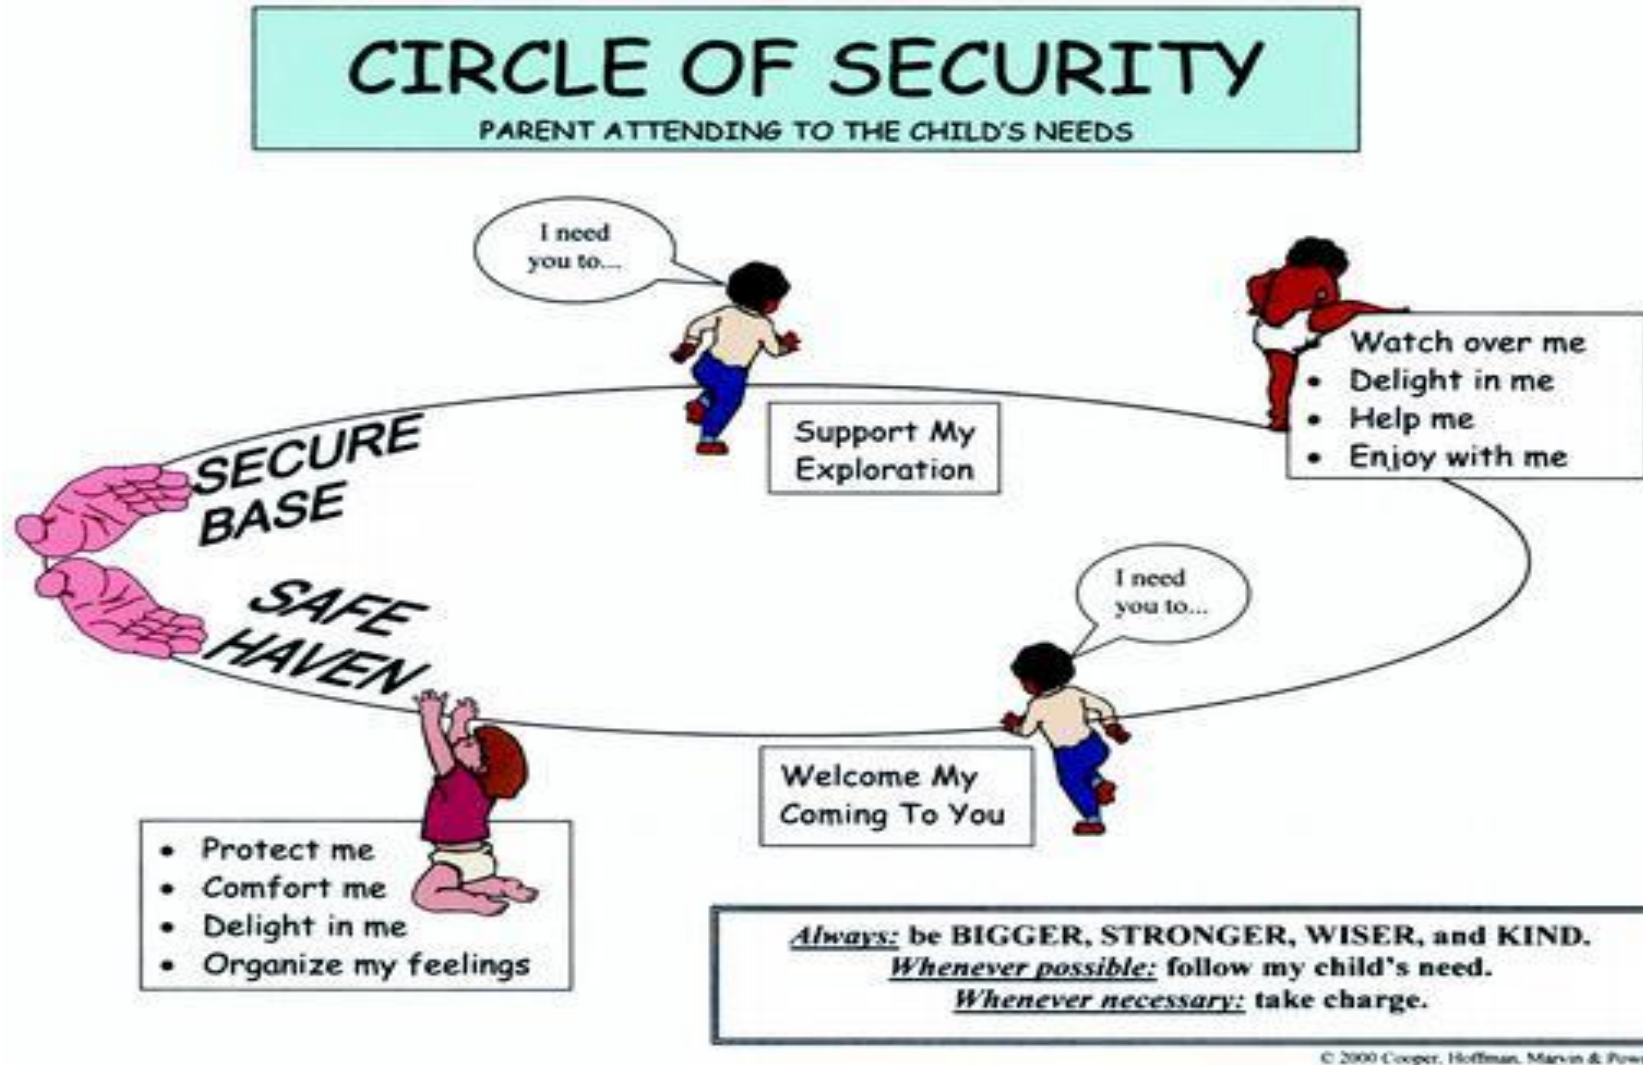

☐ Insecure-Avoidant Attachment (15-20%)

☒ **Little use of caregiver as base of exploration, little/no distress when caregiver leaves, avoids contact on her return**

☐ Disorganized (< 5%)

☒ **Dazed, Confused at reunion - No coherent strategy**

Quality of care and attachment outcomes

Secure Base

Secure

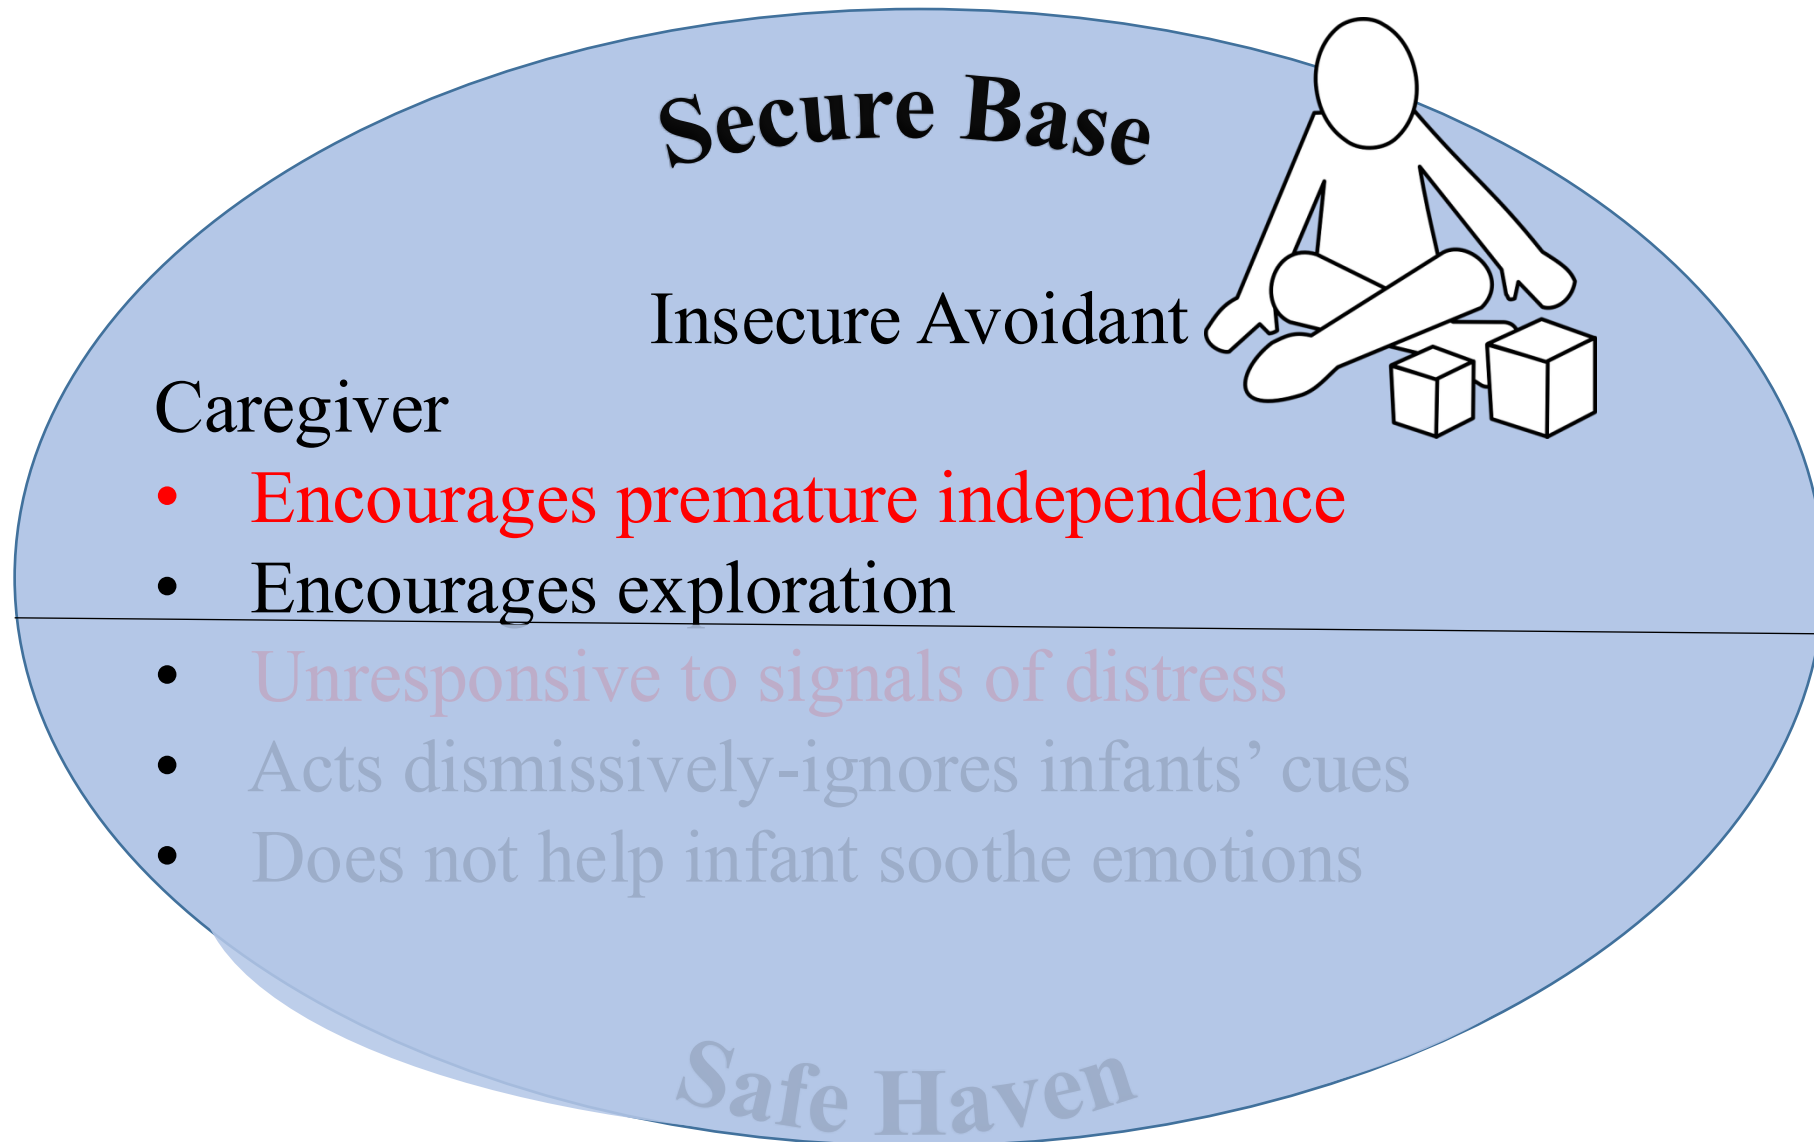

Caregiver

- Reacts quickly and positively to child's needs
- Responds appropriately to cries, non- verbal cues
- Helps soothe emotions
- Emotionally attuned with child
- Recognizes and turn towards bids for connection- such as desire for attention or play
- Creates opportunities for the child to lead interactions while coordinating with child.
- Interactional synchrony- allowing baby to set the timing and pace of feeding

Safe Haven

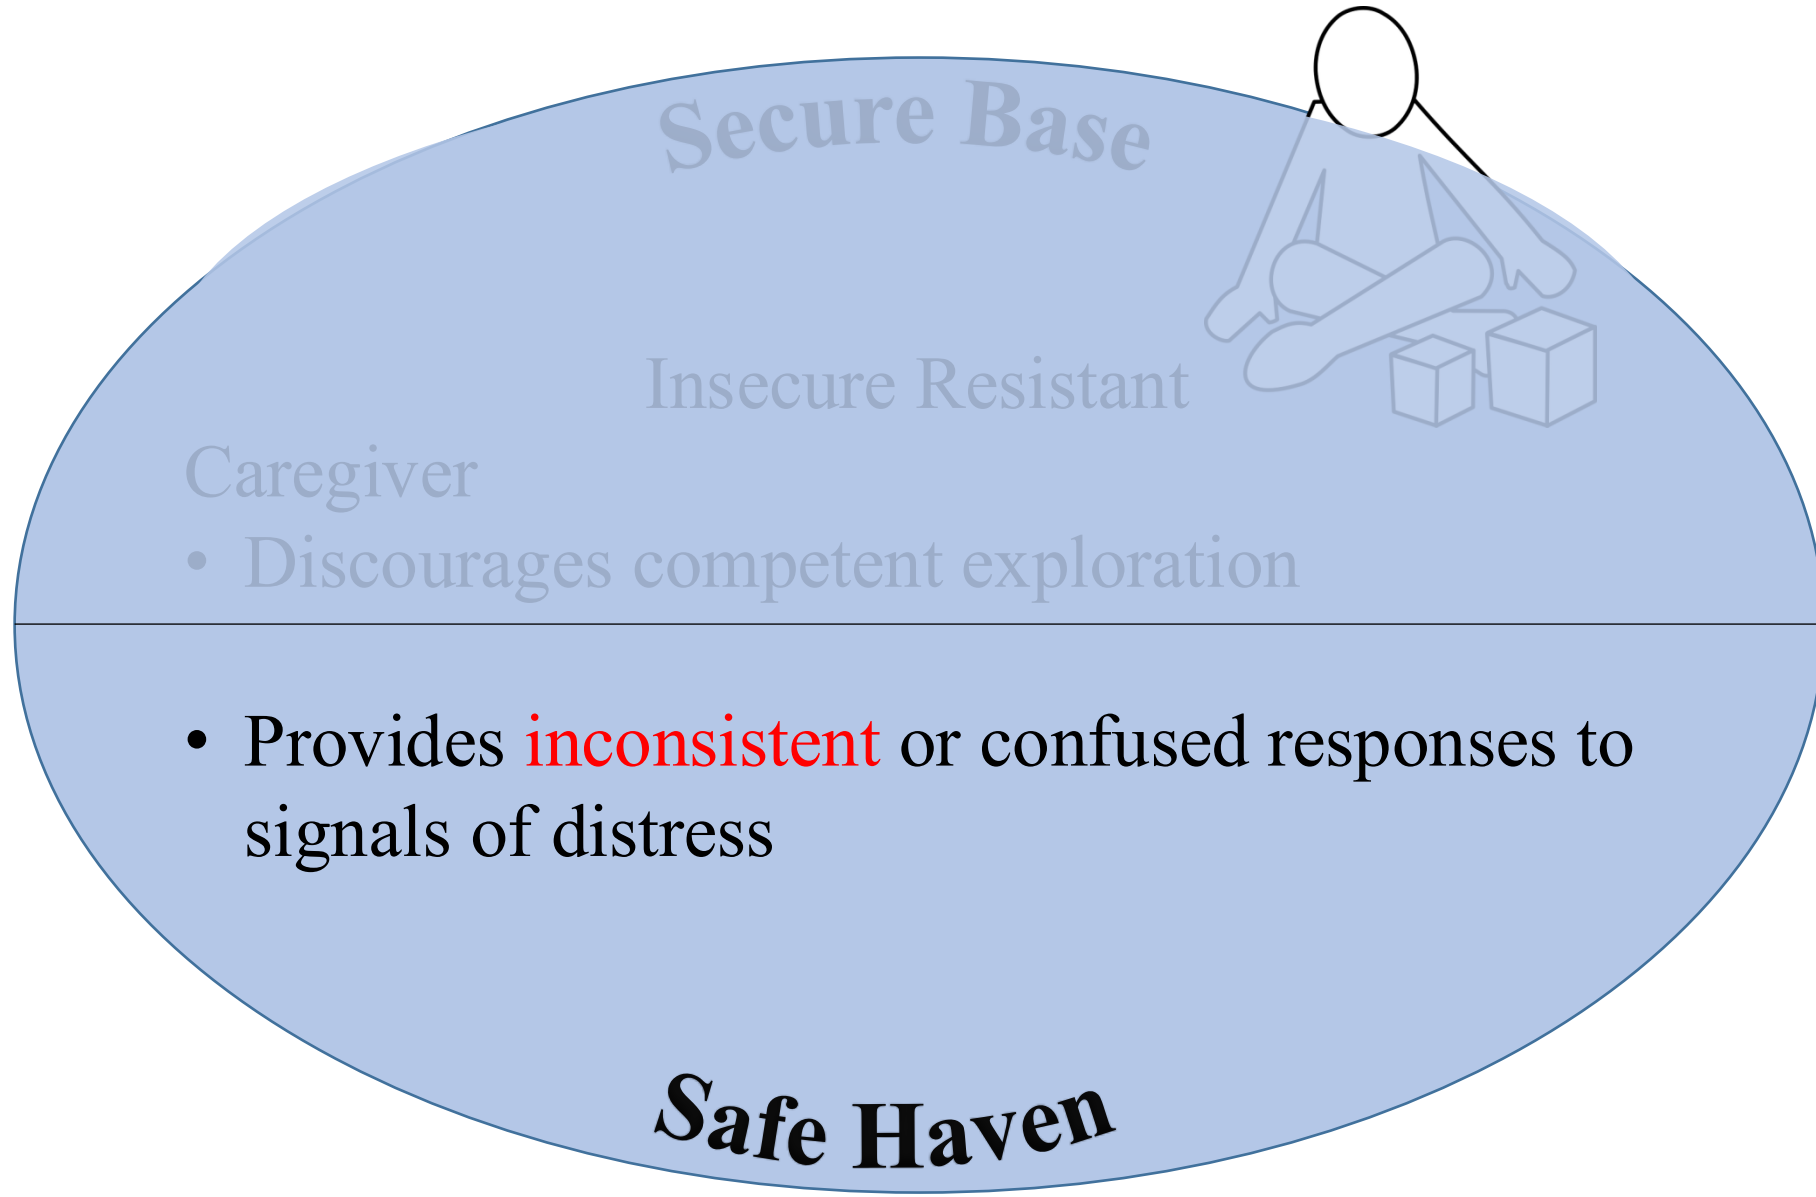

Quality of care and attachment outcomes

The caregiver of the insecure avoidant child

- Overly concerned with independence
- MVC Concern: I don't want my child to become too dependent on me, I want them to be independent
- "I let him/her cry it out"
- "I do not co-sleep because I don't want him/her to be too dependent"
- ~~"If I respond too much to child needs, child will become too dependent"~~
- Dependency Paradox- Research shows that when parents respond to child needs, children will grow up to be independent
- Children can explore independently because they have someone reliable to come back to-someone to depend on
- The avoidant child's coping strategy- Avoid relying on caregiver or anybody else
- Adaptive early on- given that parent is unavailable to provide comfort
- Dysfunctional later on-Serious relationship challenges in adulthood and with children

Quality of care and attachment outcomes

What does Responsiveness look like?

- Your professor for a particular class responds to your questions only after you send him multiple (at least 5) emails about the same question. Would you say this professor is responsive and dependable on your SETs?
- No.

Indeera sometimes cries when you put her to bed at night even though she is obviously sleepy. You are usually exhausted and have to get up early the next day. How do you typically handle the situation?

You rock Indeera for a few minutes and as soon as she looks sleepy you put her down. You let her fuss and cry until she is asleep.

You just put Indeera in her crib and let her cry herself to sleep because babies need to learn to sleep on their own.

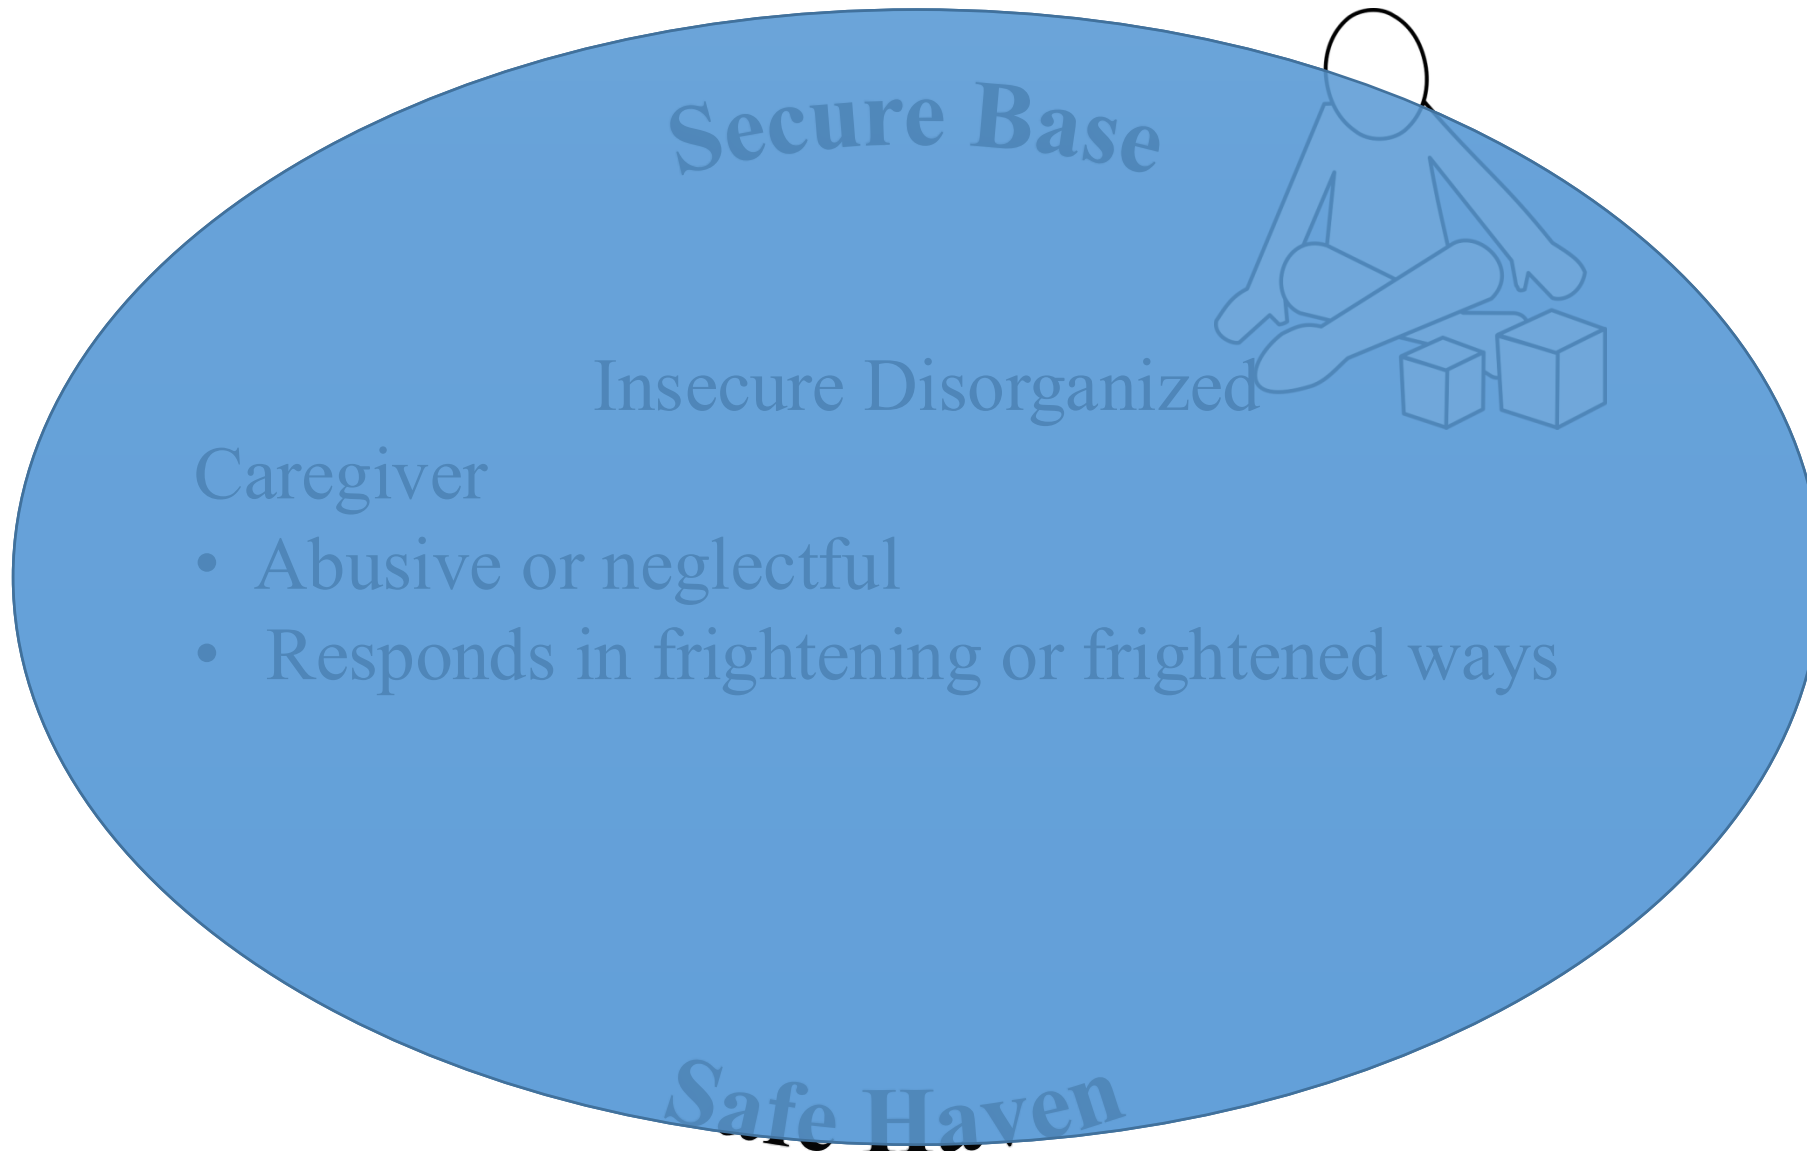

You let her cry for 10 minutes and soothe her only if she still continues crying after that.

How does Inconsistent Responding look?

- Think about what the toddler experiences
- You think, “If she doesn’t stop in 10 mins then I will soothe her”
- That means sometimes you soothe-sometimes you do not soothe.
- The 10 minute rule is arbitrary- Child does not know this rule
- She thinks, “Sometimes I am soothed, other times I am not”
- Child cannot be sure if you will be there if they need you.
- Reason behind **“sometimes accepts embrace but other times not” on MVC**
- **The Insecurely-attached child’s coping strategy- Clinging to caregiver or ignoring caregiver.**
- **Adaptive - given parent’s inconsistency**

Quality of care and attachment outcomes

- “The specialist thought that the Virtual Child was securely attached, but that the communication system between parent and child could be improved. She recommended that both parents try to read the child’s reactions more carefully and work on interpersonal communication.”

May I have this dance?

- A securely attached relationship is like a dance between the child and the caregiver.
- Partners take turns responding to each other's leads.
- There are opportunities for the child to lead while the parent co-ordinates with child.
- Interactional synchrony
 - Coordination of patterns and behavior between parent and child
 - Easily seen in interactions like feeding behavior

The parental agenda sometimes prevents us from following the child's lead

- We worry about the child.
- This child is too shy,
- not independent enough,
- not compliant enough,
- too compliant,
- too sensitive
- Our parenting choices sometimes may be designed to avoid outcomes we worry about.
- Cost- Of overlooking the child's own reactions, and not empowering him or her to shape outcomes.

Parents find they often worry that the child will create shy opportunities for them to lead the dance.

- Indira continues to be shy around adults, and has only two or three adults that she will rely on for emotional support. You also notice that she is standoffish with other toddlers in the daycare

a. You try to reduce the shyness by encouraging her to get to know a few new adults and children.

★ b. You choose one friendly new adult and one new child at a time to get to know, with you present for support. You are sure to give her several opportunities to slowly warm up to each person.

c. You decide that the shy behavior has gone on long enough and make efforts to have her associate with many new people.

★ d. You believe that shyness is a part of Indira's personality and that's OK with you. You encourage her to engage in activities with the few people around whom she feels comfortable.

My Virtual Child

I notice that two year old Indira is less clingy lately, and often wants to be put down to explore rather than to be held. Her favorite places to venture out are the park and the store.

a) I begin to worry that she is become less securely attached so I try to hold her more often.

b) I recognize this is a normal pattern of increasing independence and I leave her alone unless she asks for attention.

c) I recognize this is a normal pattern of increasing independence so I continue to provide support verbally and by displaying sympathetic faces of approval.

Which option promotes secure base and safe haven functions of attachment?

My Virtual Child

I notice that two year old Indira is less clingy lately, and often wants to be put down to explore rather than to be held. Her favorite places to venture out are the park and the store.

a) I begin to worry that she is become less securely attached so I try to hold her more often.

b) I recognize this is a normal pattern of increasing independence and I leave her alone unless she asks for attention.

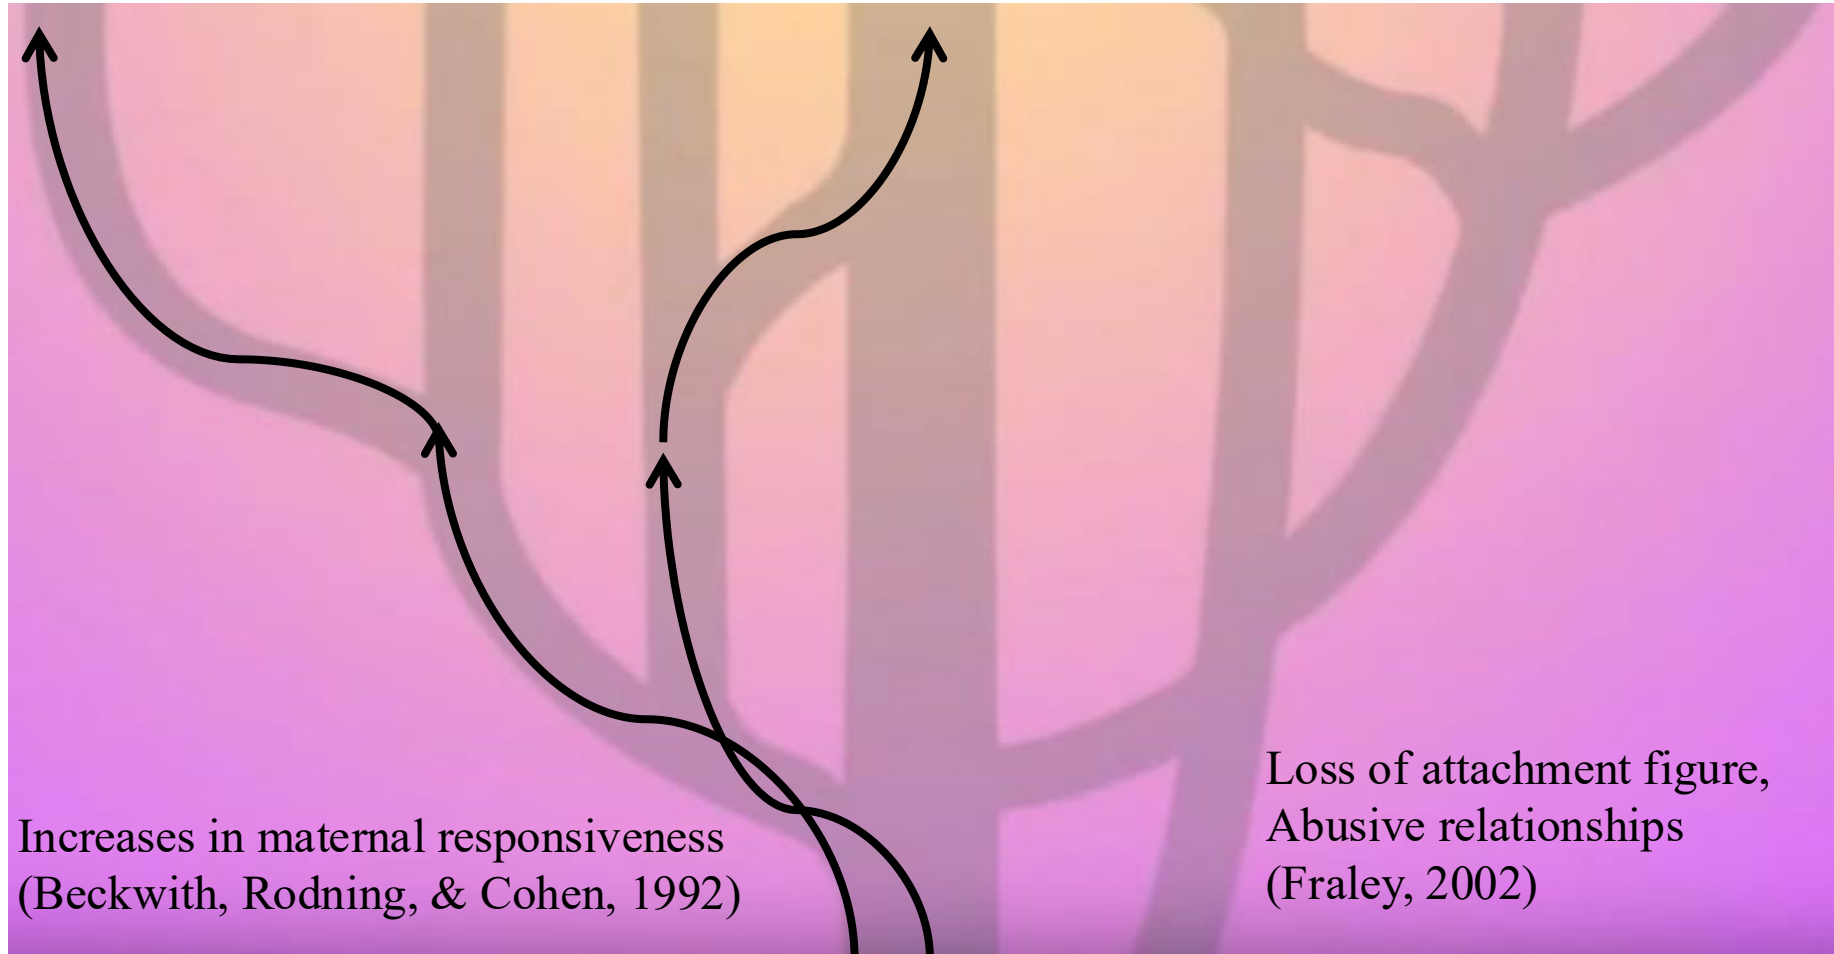

c) I recognize this is a normal pattern of increasing independence so I continue to provide support verbally and by displaying sympathetic faces of approval.

Attachment Classification Over Time

Stable but Malleable

- Adaptive to relationship experiences and contexts

Consequences of Attachment Childhood

- ❑ Secure attachment is **associated** with many positive outcomes over time
- More **independent** and explore with more autonomy (Hazen & Durrett, 1982)

Persistent Problem Solving
(Matas, Arend & Sroufe, 1978)

Better relationships
(Sroufe et al., 2005)

Symbolic play
(Slade, 1987)

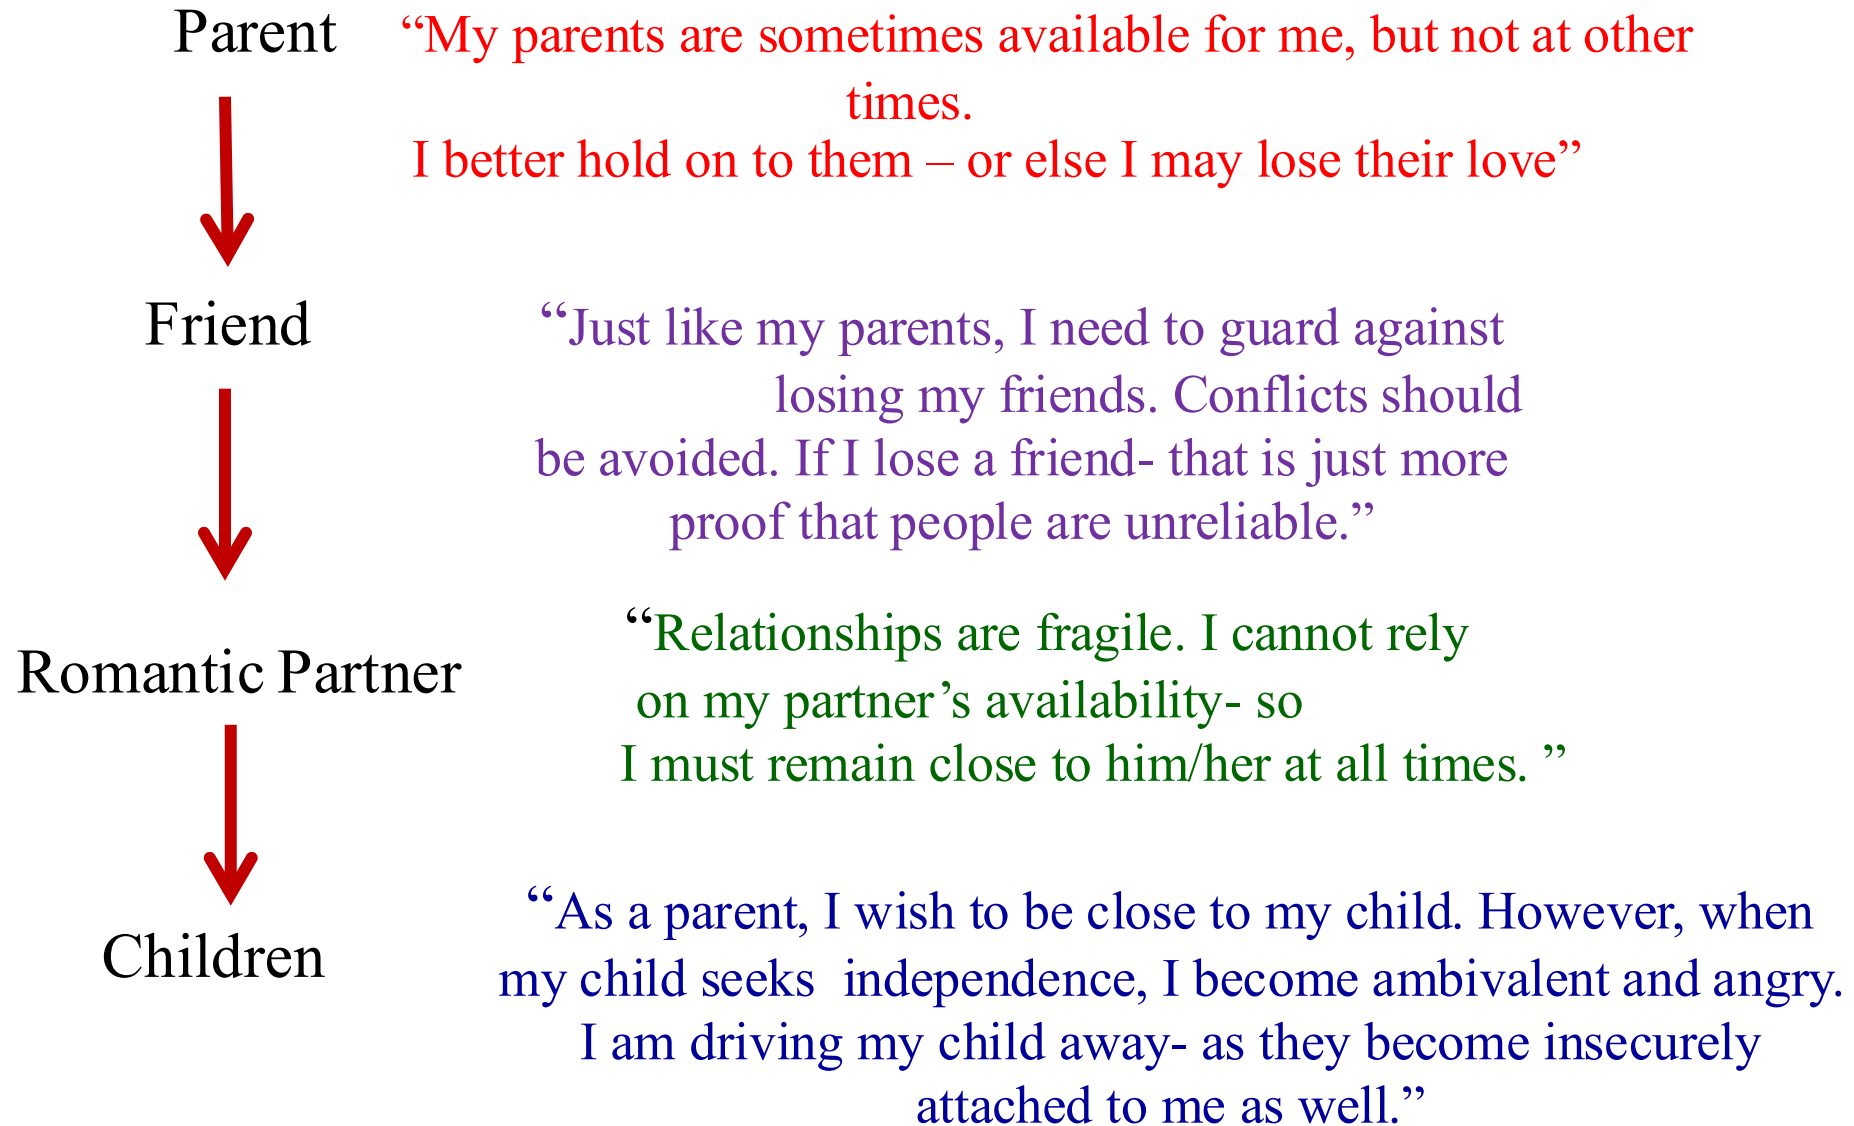

How Does Early Attachment Affect Later Relationships?

- Why are some parents so preoccupied with independence?
- Why are some parents too controlling when it comes to their children's lives?
- The answer lies in parent's attachment styles
- Our own early attachment experiences shape current and future relationships-
- **Internal Working Models - Bowlby**
 - Sets of expectation and beliefs about the self, others, and social interactions.
 - Templates guiding relationship goals and behaviors
 - Revised based on experience.
 - Example expectation: "Can I count on my attachment figure when I need them?"
 - Secure: "Yes"
 - Avoidant: "No"
 - Resistant: "Sometimes"
 - These answers **impact future social interactions**-
Friends, Romantic partners, and Children.

Insecure/**Resistant** Internal Working Models

Expectation/Belief based on early experiences

Can you sketch similar
Internal Working Models for
Avoidant and Secure individuals?

Insecure/**Resistant** Internal Working Models

Expectation/Belief based on early experiences

Parent “My parents are sometimes available for me, but not at other times.”

I better hold on to them – or else I may lose their love”

Friend

“Just like my parents, I need to guard against losing my friends. Conflicts should be avoided. If I lose a friend- that is just more proof that people are unreliable.”

Romantic Partner

“Relationships are fragile. I cannot rely on my partner’s availability- so I must remain close to him/her at all times. ”

Children

“As a parent, I wish to be close to my child. However, when my child seeks independence, I become ambivalent and angry. I am driving my child away- as they become insecurely attached to me as well.”

Insecure/**Avoidant** Internal Working Models

Parent

“My parents are not available and cannot be relied on.
I better count on myself alone.”

Friend

“Just like my parents, I should not
rely too much on my friends. It is better to be self
reliant than to depend on others.”

Romantic Partner

“I am somewhat uncomfortable being close
to my partner; I find it difficult to trust them completely. I
do not like to depend on my partner. I am better off at a
distance.”

Children

“As a parent, I find it difficult to be close to my children. I want
them to be independent. As a result, I am not available enough-
even when they ask they need me. They are becoming
insecurely attached to me as well.”

Secure Internal Working Models

Parent

“My parents are available and reliable

I can count on them as I explore and develop. I can count on them to help soothe me as well.”

Friend

“Just like my parents, I can count on my friends, who explore and learn with me. ”

Romantic Partner

“I am comfortable being close to my partner; I find it easy to trust them. I use my partner as a base for explorations and can seek comfort from them when in distress.”

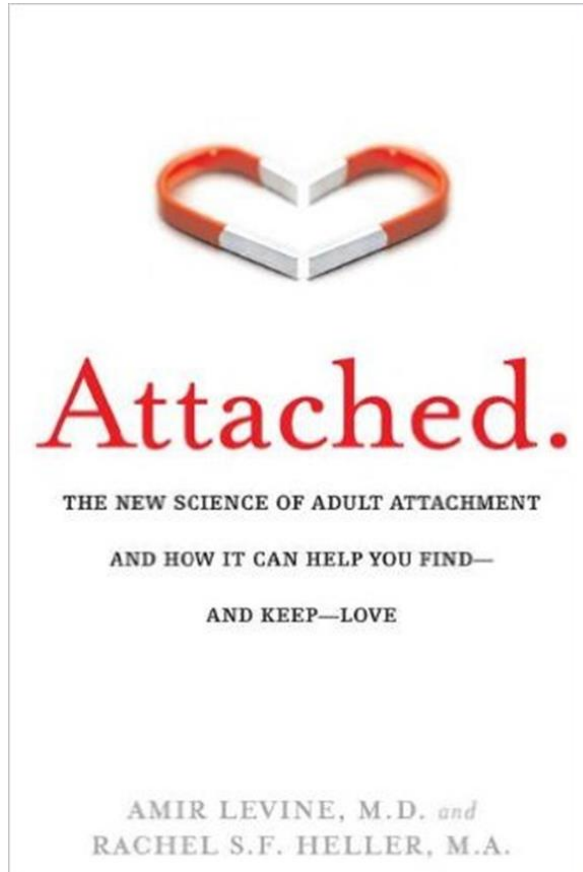

Children

“As a parent, I am available to my children. I am able to support their exploration and comfort them when needed . They are becoming securely attached to me as well.”

Attachment Behavior Cheat Sheet

Levine & Heller (2010)

Avoidant	Secure	Anxious
Sends mixed signals.	Reliable and consistent.	Wants a lot of closeness in the relationship.
Values his/her independence greatly.	Makes decisions with you.	Expresses insecurities—worries about rejection.
Devalues you (or previous partners).	Flexible view of relationships.	Unhappy when not in a relationship.
Uses distancing strategies—emotional or physical.	Communicates relationship issues well.	Plays games to keep your attention/interest.
Emphasizes boundaries in the relationship.	Can reach compromise during arguments.	Has difficulty explaining what's bothering him/her. Expects you to guess.
Has an unrealistically romantic view of how a relationship should be.	Not afraid of commitment or dependency.	Acts out.
Mistrustful—fears being taken advantage of by partner.	Doesn't view relationship as hard work.	Has a hard time <i>not</i> making things about him/herself in the relationship.
Has rigid view of relationships and uncompromising rules.	Closeness creates further closeness.	Lets you set the tone of the relationship.
During a disagreement, needs to get away or “explodes.”	Introduces friends and family early on.	Is preoccupied with the relationship.
Doesn't make his/her intentions clear.	Naturally expresses feeling for you.	Fears that small acts will ruin the relationship; believes s/he must work hard to keep your interest.
Has difficulty talking about what's going on between you.	Doesn't play games.	Suspicious that you may be unfaithful.

- Secure views of self and others in future relationships.
- Cognitive and socio-emotional adjustment.
- Secure children become secure adults who build healthy communities.

Secure
Attachment
