

Theories of Child Development

Freud's Psychosexual Stages

► Freud's Psychosexual Stages of Development

ORAL 0-2
Infant achieves gratification through oral activities such as feeding, thumb sucking and babbling.

ANAL 2-3
The child learns to respond to some of the demands of society (such as bowel and bladder control).

PHALLIC 3-7
The child learns to realize the differences between males and females and becomes aware of sexuality.

LATENCY 7-11
The child continues his or her development but sexual urges are relatively quiet.

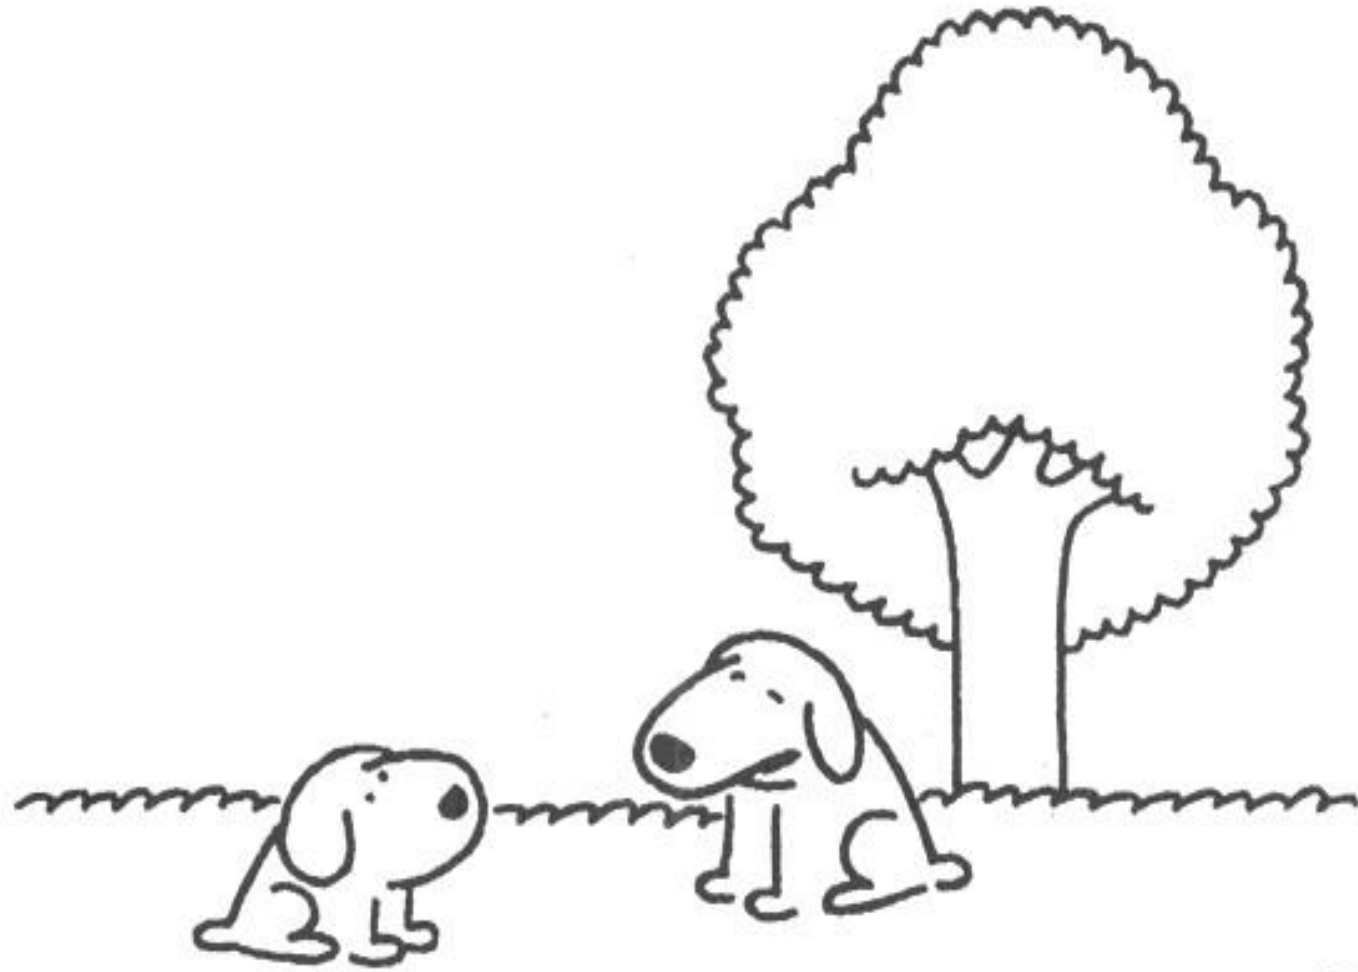

GENITAL 11-Adult
The growing adolescent shakes off old dependencies and learns to deal maturely with the opposite sex.

Erikson's Theory: Key Terms

- Psychosocial stages.
- Principle of Mastery.
- Stages represent crises that must be resolved.
- First lifespan theory of development.
- Context matters.

Erikson's Psychosocial Stages of Development

 Infancy: Trust vs. mistrust. Main developmental challenge is to establish bond with trusted caregiver.	 Toddlerhood: Autonomy vs. shame and doubt. Main developmental challenge is to develop a healthy sense of self as distinct from others.	 Early Childhood: Initiative vs. guilt. Main developmental challenge is to initiate activities in a purposeful way.	 Middle Childhood: Industry vs. inferiority. Main developmental challenge is to begin to learn knowledge and skills of culture.
 Adolescence: Identity vs. identity confusion. Main developmental challenge is to develop a secure and coherent identity.	 Early Adulthood: Intimacy vs. isolation. Main developmental challenge is to establish a committed, long-term love relationship.	 Middle Adulthood: Generativity vs. stagnation. Main developmental challenge is to care and contribute to well-being of the young.	 Late Adulthood: Ego integrity vs. despair. Main developmental challenge is to evaluate lifetime, accept it as it is.

Charles Barsotti

"My advice is to learn all the tricks you can while you're young."

Learning Theories

- Behavior is learned, a product of a sequence of *stimulus-response* chains.
- “Give me a dozen healthy infants and my own specified world to bring them up and I’ll guarantee to take any one at random and train him to become any type of specialist I might select – doctor, artist, merchant-chief, and yes, even beggar-man and thief – regardless of their talents.”

–John B. Watson

Learning Theories

- There is no place for introspection in the study of psychology. Internal states are irrelevant to behavior.
- Learning theories fall into two broad categories:
 - ***classical conditioning***
 - ***operant conditioning***

Classical Conditioning

Unconditioned
Stimulus (**meat**) → Unconditioned
Response (**salivate**)

Plus

Neutral
Stimulus (**bell**)

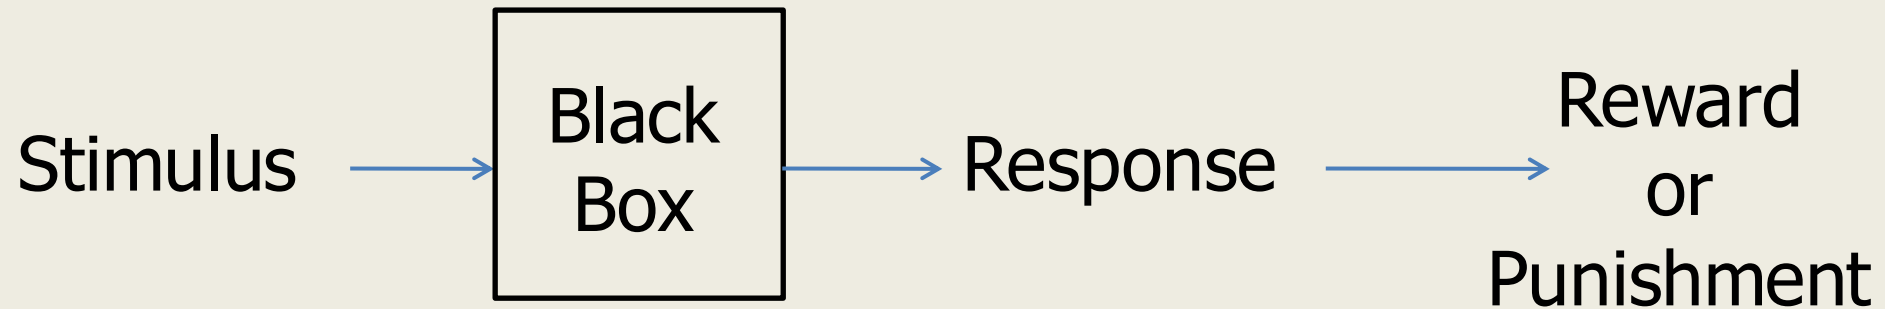

**Which
Becomes**

Conditioned
Stimulus (**bell**) → Conditioned
Response (**salivate**)

Operant Conditioning

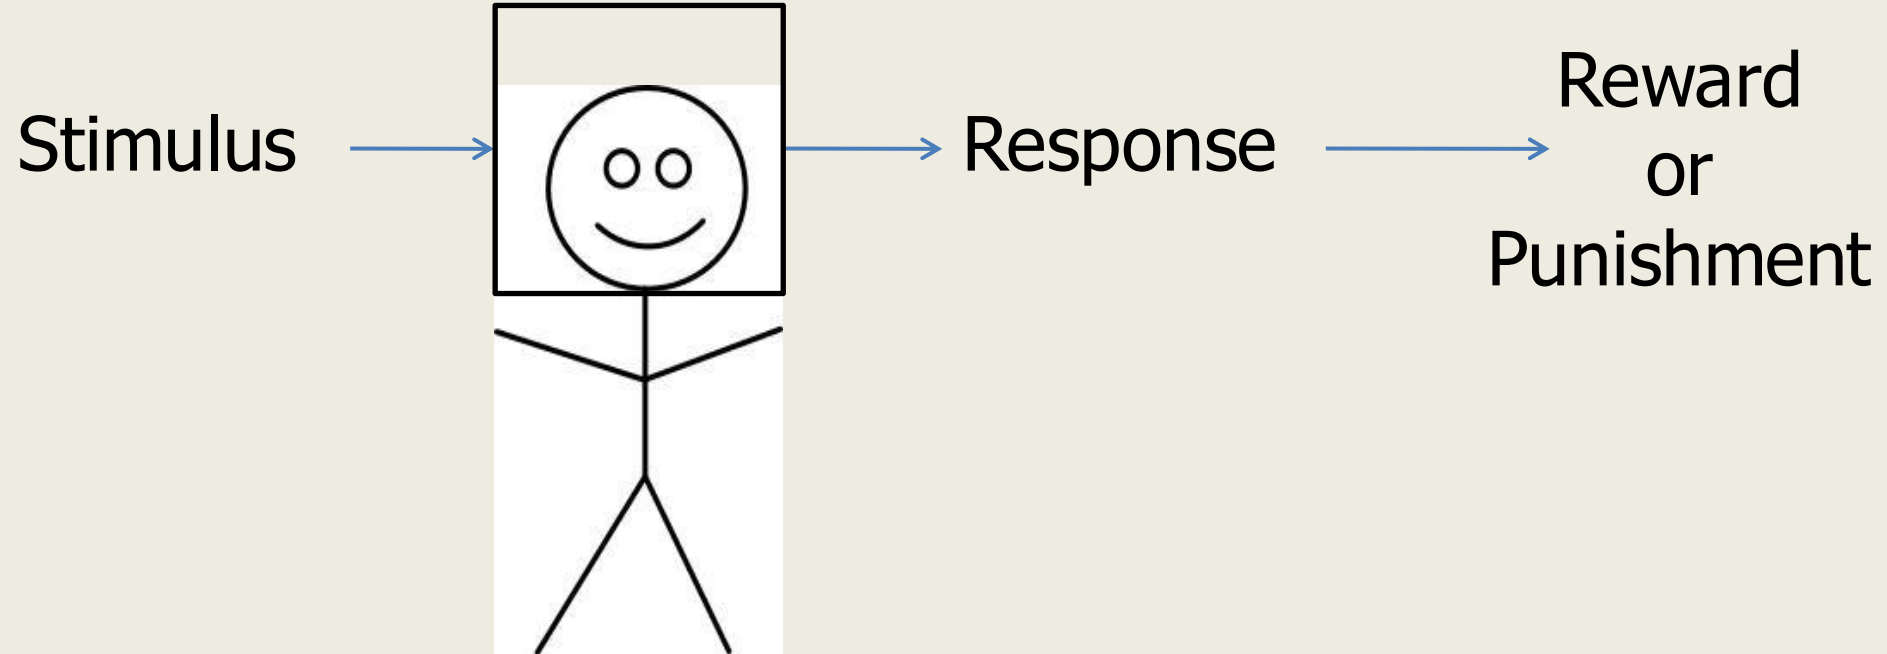

- Consequences determine likelihood that behavior will be repeated in future.
- Rewards = Reinforcement
 - Increase the likelihood that a behavior will be repeated.
- Costs = Punishment
 - Decrease the likelihood that a behavior will be repeated.
- https://www.youtube.com/watch?v=qy_mIEnnlF4&t=1s

Social Learning Theory

Bandura modified operant conditioning theory to explain what goes on inside the black box.

Social Learning Theory

What's Different About Social Learning Theory?

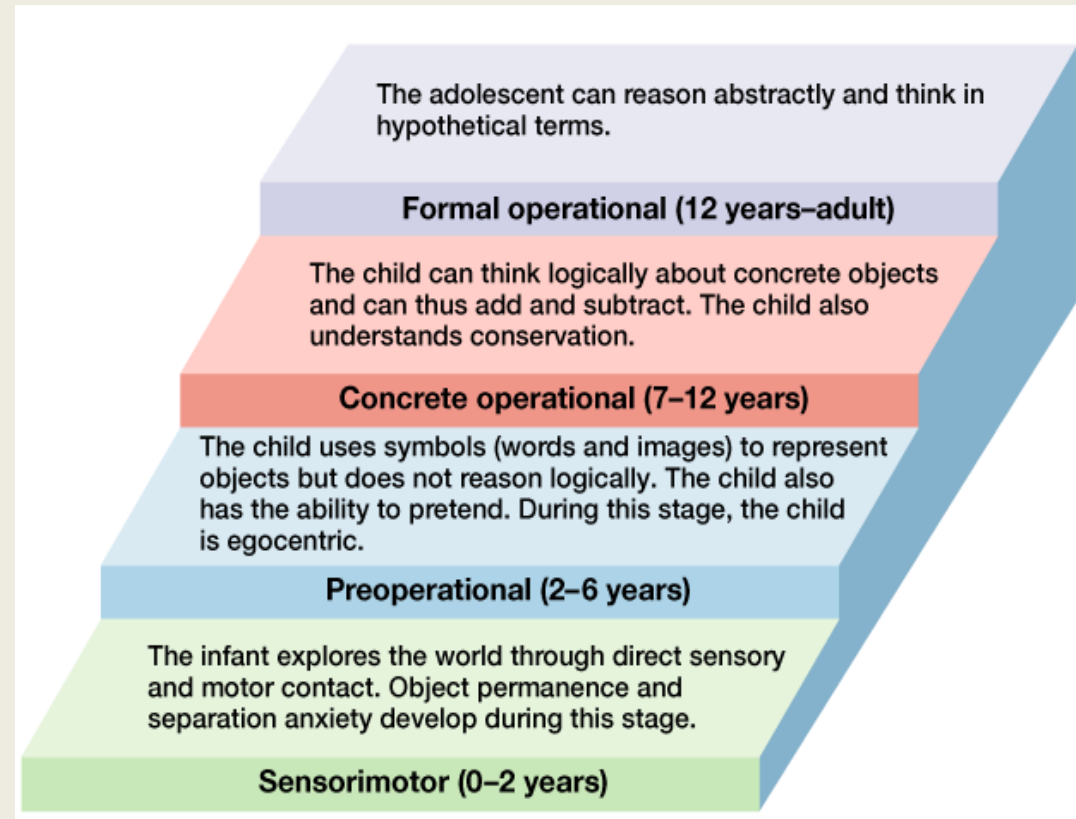

- Observational learning-Modeling
 - Bobo Doll example (5 min): <http://www.youtube.com/watch?v=zerCK0IRjp8>
- Self-administered reinforcement and punishment
- Vicarious learning

Bronfenbrenner's Ecological Systems Theory

- Viewed development as “changing individuals in changing environments,”
- Children cannot be separated from context.

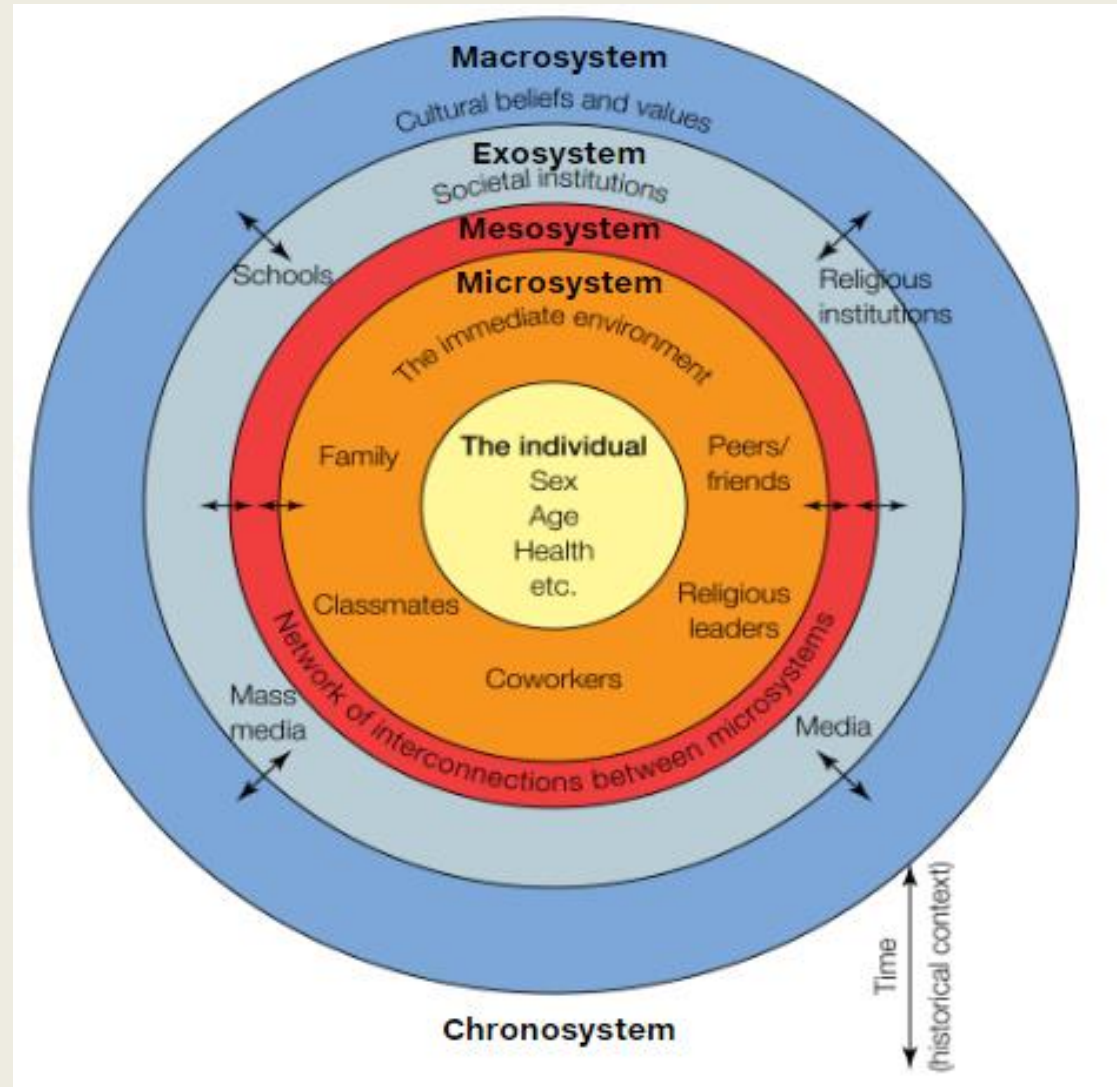

Piaget's Theory of Cognitive Development

- Four stages of cognitive and intellectual development.
- Thinking at each stage is qualitatively different.
- Assimilation
Accommodation

<http://www.youtube.com/watch?v=TRF27F2bn-A>

Bronfenbrenner's Ecological Systems Theory Activity

Bronfenbrenner's Ecological Systems Theory

- Micro: Social systems in which child is a direct participant.
 - Family, peers, classmates, teachers
- Meso: Interactions of microsystems
 - Parents interacting with teacher
- Exo: Social systems the child is *not* regularly involved in
 - Neighbors, police, extended family, **parents' workplace**
- Macro: Attitudes, laws, and ideologies of society
 - Affects Micro, Meso, and Exo systems
 - Laws that affect families and children
 - One child policy.
- Chrono: Changes in persons or environments across time.
 - Acute changes: natural disasters
 - Cohort Effects: Change of values or cultural norm in short period of time.
 - E.g., Women in workforce, Migration of workers to cities for better jobs

Culture and Development

- Cultural inventions influence our development. Can you name some cultural inventions that have changed the course of our lives?
- Ink and paper
- Alphabet
- Money
- Calendars
- Microscope
- Boats and Cars
- Medicine
- Radio
- Condoms and Contraception
- iPhone!

Vygotsky's Sociocultural Theory

- Cognitive development and Learning happens through social interactions
- Cultural context determines what you learn
- Consider these two sets of children:

Vygotsky's Sociocultural Theory

Tools of Intellectual adaptation

The tools children are provided by their culture to guide thinking and problem solving.

http://www.ted.com/talks/sugata_mitra_the_child_driven_education#t-1011531

What were some of the remarkable things
in this story?
Surprising things?

- Cultural tool that shaped learning=the computer
- Learning was socially constructed
- Peers supported learning

Vygotsky's Sociocultural Theory

Mental Functioning is socially constructed

- Zone of Proximal Development
- Scaffolding: supportive others help the child.
- Guided Participation: Children learn through daily, routine activities. Culture shapes these activities.
